1.

In order to show that S is a field, we'll need to prove the following ***binary operator*** properties:

1. In S, there are two members, zero - 0_S and one - 1_S
2. S supports the addition and multiplication binary operators
3. Every member in S can be negated, i.e. for every x there is $-x$
4. For every member in S that is not 0_S, $\exists x^{-1} \in S$, it is called the multiplicative inverse of x

In addition, the mentioned binary operators should satisfy the following properties, referred to as ***field axioms***:

1. Associativity of addition and multiplication:
$$a + (b + c) = (a + b) + c$$
$$a \cdot (b \cdot c) = (a \cdot b) \cdot c$$
2. Commutativity of addition and multiplication:
$$a + b = b + a$$
$$a \cdot b = b \cdot a$$
3. Additive and multiplicative identity
$$a + 0 = a$$
$$a \cdot 1 = a$$
4. Additive and multiplicative inverses
$$a + (-a) = 0$$
$$a \cdot a^{-}1 = 1$$
5. Distributivity
$$a(b + c) = (a \cdot b) + (a \cdot c)$$

2.
